

GUARD RAILS

for Roof Access Hatch

Aluminum Guard Rails are designed and tested to provide fall protection for workers near an open access roof hatch.

The system features removable side Guard Rails and Chain Gates, to allow for maximum egress and passage of large equipment.

Safety Criteria

Guard Rails and Chain Gates system has been tested by an accredited independent test laboratory, as typically installed on a roof hatch, to meet the following standards:

- OSHA** 1910.23, 1910.27
- ANSI** A1264.1

Installation

Guard Rails are installed on the roof hatch directly, which eliminates the need for extra holes to be drilled on to the roof surface. The mounting bracket is designed to align with accessory holes on typical roof hatches.
